SMALL MOLECULE INHIBITORS OF PROTEIN ARGININE METHYLTRANSFERASES (PRMTs)

[0001] This application claims the benefit of U.S. Provisional Application Serial No. 60/892,056, filed February 28, 2007.

BACKGROUND OF THE INVENTION**(a) Field of the Invention**

[0002] The present invention relates to novel compounds which are inhibitors of Protein Arginine Methyl Transferases (PRMTs), to methods of using such compounds for inhibiting protein methyltransferases, to methods of using such compounds in the treatment of hyperproliferative, inflammatory, infectious, and immunoregulatory disorders and diseases, and to pharmaceutical compositions containing such compounds.

[0003] The compounds and pharmaceutical compositions of the invention are particularly well suited as inhibitors of protein methyltransferases and, consequently, can be advantageously used as therapeutic agents for the treatment of certain diseases and/or conditions, including cancer, asthma, COPD, allergic diseases; rheumatoid arthritis, spinal muscular atrophy, atherosclerosis, and psoriasis; viral infections; solid organ transplant rejection, osteoarthritis, and inflammatory bowel syndrome. This invention also relates to methods of using the compounds of this invention alone or in combination with other pharmaceutically active agents.

(b) Summary of the Related Art

[0004] PRMTs are enzymes that catalyze the transfer of methyl groups from S-Adenosyl-L-Methionine (SAM) to specific arginine residues of proteins. Arginine methylation of proteins has been implicated to play roles in pre-mRNA splicing, nucleo-cytoplasmic RNA transport, signal transduction and transcriptional activation.

[0005] To date, eight family members have been identified (PRMTs 1-8) in mammalian cells and each appear to have distinct substrate preferences and biological functions. Co-activator Associated Arginine Methyltransferase-1 (CARM-1; also called PRMT4) has been shown to methylate histone H3 both *in vitro* and *in vivo*, and it is speculated that this modification positively affects chromatin remodeling and thus transcriptional activation. CARM-1 also methylates non-histone proteins, such as CREB-binding protein (CBP)/p300 (Chevallard-Briet *et al.*, 2002; Lee *et al.*, 2005; Xu *et al.*, 2001), steroid receptor co-activator (SRC)-3 (Naeem *et al.*, 2006), poly-A binding protein (PABP) (Lee and Bedford, 2002), members of the Hu family of proteins HuD and HuR (Li *et al.*, 2002; Fujiwara *et al.*, 2006), and splicing factors CA150, SAP49, SmB, and U1C (Espego *et al.*, 2002; Cheng *et al.*, 2007).

[0006] CARM-1 has oncogenic potential, through its ability to modulate chromatin organization, regulate transcription and increase the half-life of specific mRNAs involved in cancer. CARM-1 plays a co-activator role in androgen- and estrogen-induced gene expression mediated by the nuclear hormone receptor family of transcription factors (Chen *et al.*, 1999). Mutations of critical residues in the catalytic domain compromise the co-activator function of CARM-1 and the arginine-specific histone methylation of the promoter regions of nuclear receptor-responsive genes, suggesting that the integrity of its methyltransferase domain is indispensable for its co-activator function (Chen *et al.*, 1999; Koh *et al.*, 2001; Wang *et al.*, 2001). CARM-1 is also involved in the activation of cyclin E1 gene expression (El Messaoudi *et al.*, 2006). CARM-1 levels are significantly higher in prostatic intraepithelial neoplasia and prostatic adenocarcinoma compared to benign prostate tissue, and higher in patients with androgen-independent prostatic adenocarcinoma compared to patients without previous hormonal treatment (Hong *et al.*, 2004). From these findings, it is an attractive chemotherapeutic option to inhibit the enzymatic function of CARM-1 using a small molecule inhibitor.

[0007] CARM-1 may also play a role in inflammation and viral gene expression. Studies of cells derived from CARM-1-null mice and knockdown experiments reveal that CARM-1 acts as a co-activator for NF-kappaB in the regulation of inflammatory gene expression (Covic *et al.*, 2004; Miao *et al.*, 2006; Teferedegne *et al.*, 2006), and cooperates with CBP and CIITA in the expression of the major histocompatibility class II gene in response to interferon-gamma (Zita *et al.*, 2005). CARM-1 is also implicated in the transactivation of the human T-cell lymphotropic virus type 1 long terminal repeat through direct interaction with Tax (Jeong *et al.*, 2006). These findings suggest that inhibition of CARM-1 may also be effective against viral infection and inflammatory disorders.

[0008] It would be highly desirable to be provided with novel compounds which are inhibitors of protein arginine methyl transferase. It would also be highly desirable to be provided with novel compounds which are inhibitors of CARM-1.

In a preferred embodiment, the terms "treating", "treatment", or the like, as used herein covers the treatment of a disease-state in an organism and includes at least one of (ii), (iii) and (iv) above.

[0032] As used herein, the terms "protein arginine methyltransferase" and "PRMT" are intended to refer to any one of a family of enzymes that catalyze the transfer of methyl groups from S-adenosyl-L-methionine (SAM) to specific arginine residues of proteins. Preferred protein arginine methyltransferases include Type I and Type II enzymes. The type I enzymes have been described to catalyze the formation of ω -N^G-monomethylarginine and asymmetric ω -N^G, ω -N^G-dimethylarginine, whereas the type II enzymes have been described to catalyze the formation of ω -N^G-monomethylarginine and symmetric ω -N^G, ω -N^G-dimethylarginine. A family of at least eight mammalian protein arginine methyltransferases have been described. Preferably the arginine methyltransferase is a mammalian PRMT, including, but not limited to, PRMT1, PRMT2, PRMT3, PRMT4 (also called CARM-I), PRMT5, PRMT6, PRMT7 and PRMT8. In some other preferred embodiments, the protein arginine methyltransferase is derived from a fungal source.

[0033] The terms "protein arginine methyltransferase inhibitor" and "inhibitor of protein arginine methyltransferase" are intended to mean a compound having a structure as defined

herein, which is capable of inhibiting enzymatic activity of a protein arginine methyltransferase.

[0034] The term “inhibiting protein arginine methyltransferase enzymatic activity”, and the like, is intended to mean reducing the ability of a protein arginine methyltransferase to transfer a methyl group to an arginine residue of a protein. The concentration of inhibitor which reduces the activity of a protein arginine methyltransferase to 50% of that of the uninhibited enzyme is determined as the IC_{50} value. In some preferred embodiments, such reduction of protein arginine methyltransferase activity is at least 50%, more preferably at least about 75%, and still more preferably at least about 90%. In other preferred embodiments, protein arginine methyltransferase activity is reduced by at least 95% and more preferably by at least 99%.

[0035] Preferably, such inhibition is specific, *i.e.*, the protein arginine methyltransferase inhibitor reduces the ability of a protein arginine methyltransferase to transfer a methyl group to an arginine residue of a protein at a concentration that is lower than the concentration of the inhibitor that is required to produce another, unrelated biological effect. Preferably, the concentration of the inhibitor required for protein arginine methyltransferase inhibitory activity is at least 2-fold lower, more preferably at least 5-fold lower, even more preferably at least 10-fold lower, and most preferably at least 20-fold lower than the concentration required to produce an unrelated biological effect.

[0036] For simplicity, chemical moieties are defined and referred to throughout primarily as univalent chemical moieties (*e.g.*, alkyl, aryl, etc.). Nevertheless, such terms are also used to convey corresponding multivalent moieties under the appropriate structural circumstances clear to those skilled in the art. For example, while an “alkyl” moiety generally refers to a monovalent radical (*e.g.* CH_3-CH_2-), in certain circumstances a bivalent linking moiety can be “alkyl,” in which case those skilled in the art will understand the alkyl to be a divalent radical (*e.g.*, $-CH_2-CH_2-$), which is equivalent to the term “alkylene.” (Similarly, in circumstances in which a divalent moiety is required and is stated as being “aryl,” those skilled in the art will understand that the term “aryl” refers to the corresponding divalent moiety, arylene). All atoms are understood to have their normal number of valences for bond formation (*i.e.*, 4 for carbon, 3 for N, 2 for O, and 2, 4, or 6 for S, depending on the oxidation state of the S). On occasion a moiety may be defined, for example, as $(A)_a-B-$, wherein a is 0 or 1. In such instances, when a is 0 the moiety is $B-$ and when a is 1 the moiety is $A-B-$.

[0037] For simplicity, reference to a “ C_n-C_m ” heterocyclyl or “ C_n-C_m ” heteroaryl means a heterocyclyl or heteroaryl having from “ n ” to “ m ” annular atoms, where “ n ” and “ m ” are integers. Thus, for example, a C_5-C_6 heterocyclyl is a 5- or 6-membered ring having at least one heteroatom, and includes pyrrolidinyl (C_5) and piperidinyl (C_6); C_6 heteroaryl includes, for example, pyridyl and pyrimidyl.

[0038] The term “hydrocarbyl” refers to a straight, branched, or cyclic alkyl, alkenyl, or alkynyl, each as defined herein. A “ C_0 ” hydrocarbyl is used to refer to a covalent bond. Thus,

"C₀-C₃hydrocarbyl" includes a covalent bond, methyl, ethyl, ethenyl, ethynyl, propyl, propenyl, propynyl, and cyclopropyl.

[0039] The term "alkyl" is intended to mean a straight chain or branched aliphatic group having from 1 to 12 carbon atoms, preferably 1-8 carbon atoms, and more preferably 1-6 carbon atoms. Other preferred alkyl groups have from 2 to 12 carbon atoms, preferably 2-8 carbon atoms and more preferably 2-6 carbon atoms. Preferred alkyl groups include, without limitation, methyl, ethyl, propyl, isopropyl, butyl, isobutyl, sec-butyl, tert-butyl, pentyl, hexyl and the like. A "C₀" alkyl (as in "C₀-C₃alkyl") is a covalent bond.

[0040] The term "alkenyl" is intended to mean an unsaturated straight chain or branched aliphatic group with one or more carbon-carbon double bonds, having from 2 to 12 carbon atoms, preferably 2-8 carbon atoms, and more preferably 2-6 carbon atoms. Preferred alkenyl groups include, without limitation, ethenyl, propenyl, butenyl, pentenyl, and hexenyl.

[0041] The term "alkynyl" is intended to mean an unsaturated straight chain or branched aliphatic group with one or more carbon-carbon triple bonds, having from 2 to 12 carbon atoms, preferably 2-8 carbon atoms, and more preferably 2-6 carbon atoms. Preferred alkynyl groups include, without limitation, ethynyl, propynyl, butynyl, pentynyl, and hexynyl.

[0042] The terms "alkylene," "alkenylene," or "alkynylene" as used herein are intended to mean an alkyl, alkenyl, or alkynyl group, respectively, as defined hereinabove, that is positioned between and serves to connect two other chemical groups. Preferred alkylene groups include, without limitation, methylene, ethylene, propylene, and butylene. Preferred alkenylene groups include, without limitation, ethenylene, propenylene, and butenylene. Preferred alkynylene groups include, without limitation, ethynylene, propynylene, and butynylene.

[0043] The term "cycloalkyl" is intended to mean a saturated or unsaturated mono-, bi-, tri- or poly-cyclic hydrocarbon group having about 3 to 15 carbons, preferably having 3 to 12 carbons, preferably 3 to 8 carbons, and more preferably 3 to 6 carbons. In certain preferred embodiments, the cycloalkyl group is fused to an aryl, heteroaryl or heterocyclic group. Preferred cycloalkyl groups include, without limitation, cyclopenten-2-enone, cyclopenten-2-enol, cyclohex-2-enone, cyclohex-2-enol, cyclopropyl, cyclobutyl, cyclobutenyl, cyclopentyl, cyclopentenyl, cyclohexyl, cyclohexenyl, cycloheptyl, cyclooctyl, etc.

[0044] The term "heteroalkyl" is intended to mean a saturated or unsaturated, straight chain or branched aliphatic group, wherein one or more carbon atoms in the group are independently replaced by a heteroatom selected from the group consisting of O, S, and N.

[0045] The term "aryl" is intended to mean a mono-, bi-, tri- or polycyclic aromatic moiety, preferably a C₆-C₁₄aromatic moiety, preferably comprising one to three aromatic rings. Preferably, the aryl group is a C₆-C₁₀aryl group, more preferably a C₆aryl group. Preferred aryl groups include, without limitation, phenyl, naphthyl, anthracenyl, and fluorenyl.

[0046] The terms "aralkyl" or "arylalkyl" is intended to mean a group comprising an aryl group covalently linked to an alkyl group. If an aralkyl group is described as "optionally substituted", it is intended that either or both of the aryl and alkyl moieties may independently be optionally substituted or unsubstituted. Preferably, the aralkyl group is (C₁-C₆)alk(C₆-C₁₀)aryl, including, without limitation, benzyl, phenethyl, and naphthylmethyl. For simplicity, when written as "arylalkyl" this term, and terms related thereto, is intended to indicate the order of groups in a compound as "aryl - alkyl". Similarly, "alkyl-aryl" is intended to indicate the order of the groups in a compound as "alkyl-aryl".

[0047] The terms "heterocyclyl", "heterocyclic" or "heterocycle" are intended to mean a group which is a mono-, bi-, or polycyclic structure having from about 3 to about 14 atoms, wherein one or more atoms are independently selected from the group consisting of N, O, and S. The ring structure may be saturated, unsaturated or partially unsaturated. In certain preferred embodiments, the heterocyclic group is non-aromatic. In a bicyclic or polycyclic structure, one or more rings may be aromatic; for example one ring of a bicyclic heterocycle or one or two rings of a tricyclic heterocycle may be aromatic, as in indan and 9,10-dihydro anthracene. Preferred heterocyclic groups include, without limitation, epoxy, aziridinyl, tetrahydrofuranyl, pyrrolidinyl, piperidinyl, piperazinyl, thiazolidinyl, oxazolidinyl, oxazolidinonyl, and morpholino. Examples of such fused heterocycles include, without limitation, tetrahydroquinoline and dihydrobenzofuran. Specifically excluded from the scope of this term are compounds where an annular O or S atom is adjacent to another O or S atom.

[0048] In certain preferred embodiments, the heterocyclic group is a heteroaryl group. As used herein, the term "heteroaryl" is intended to mean a mono-, bi-, tri- or polycyclic group having 5 to 14 ring atoms, preferably 5, 6, 9, or 10 ring atoms; having 6, 10, or 14 pi electrons shared in a cyclic array; and having, in addition to carbon atoms, between one or more heteroatoms independently selected from the group consisting of N, O, and S. [0064] The term "halogen" or "halo" is intended to mean chlorine, bromine, fluorine, or iodine. As herein employed, the term "acyl" refers to an alkylcarbonyl or arylcarbonyl substituent. The term "acylamino" refers to an amide group attached at the nitrogen atom (*i.e.*, R-CO-NH-). The term "carbamoyl" refers to an amide group attached at the carbonyl carbon atom (*i.e.*, NH₂-CO-). The nitrogen atom of an acylamino or carbamoyl substituent is additionally optionally substituted. For example, an optionally substituted phenyl includes, but is not limited to, the following:

[0068] The term "protecting group" is intended to mean a group used in synthesis to temporarily mask the characteristic chemistry of a functional group because it interferes with another reaction. A good protecting group should be easy to put on, easy to remove and in high yielding reactions, and inert to the conditions of the reaction required. A protecting group or protective group is introduced into a molecule by chemical modification of a functional group in order to obtain chemoselectivity in a subsequent chemical reaction. One skilled in the art will recognize that during any of the processes for preparation of the compounds in the present invention, it may be necessary and/or desirable to protect sensitive or reactive groups on any of the molecules concerned. This may be achieved by means of conventional protecting groups, such as but not limited to Bn- (or -CH₂Ph), -CHPh₂, alloc (or CH₂=CH-CH₂-O-C(O)-), BOC-, -Cbz (or Z-), -F-moc, -C(O)-CF₃, N-Phthalimide, 1-Adoc-, TBDMS-, TBDPS-, TMS-, TIPS-, IPDMS-, -SiR₃, SEM-, t-Bu-, Tr-, THP- and Allyl-, and those described in standard textbooks, such as Greene, T.W. et al., *Protective Groups in Organic Synthesis*,

Wiley, N.Y. (1999). These protecting groups may be removed at a convenient stage using methods known from the art.

[0069] When a functional group is termed "protected", this means that the group is in modified form to mitigate, especially preclude, undesired side reactions at the protected site.

[0070] The term "therapeutically effective amount" as that term is used herein refers to an amount which elicits the desired therapeutic effect. The therapeutic effect is dependent upon the disease being treated and the results desired. As such, the therapeutic effect can be a decrease in the severity of symptoms associated with the disease and/or inhibition (partial or complete) of progression of the disease, or reversal or regression of the disease-state, preferably eliminating or curing of the disease. In other embodiments, the therapeutic effect can be preventing the disease-state from occurring, in particular, when an animal is predisposed to the disease-state but has not yet been diagnosed as having it. Further, the therapeutic effect can be inhibition of PRMT and/or CARM-I. The amount needed to elicit the therapeutic effect can be determined based on the age, health, size and sex of the patient. Optimal amounts can also be determined based on monitoring of the patient's response to treatment.

[0071] The compounds of the present invention form salts which are also within the scope of this invention. Reference to a compound of the formula (I) herein is understood to include reference to salts thereof, unless otherwise indicated.

[0072] The term "salt(s)", as employed herein, denotes acidic and/or basic salts formed with inorganic and/or organic acids and bases. In addition, when a compound of formula (I) contains both a basic moiety, such as but not limited to a pyridine or imidazole, and an acidic moiety such as but not limited to a carboxylic acid, zwitterions ("inner salts") may be formed and are included within the term "salt(s)" as used herein. Pharmaceutically acceptable (i.e., non-toxic (exhibiting minimal or no undesired toxicological effects), physiologically acceptable) salts are preferred, although other salts are also useful, e.g., in isolation or purification steps which may be employed during preparation. Salts of the compounds of the invention may be formed, for example, by reacting a compound of the present invention with an amount of acid or base, such as an equivalent amount, in a medium such as one in which the salts precipitates or in an aqueous medium followed by lyophilization.

[0073] The compounds of the present invention which contain a basic moiety, such as but not limited to an amine or a pyridine or imidazole ring, may form salts with a variety of organic and inorganic acids. Exemplary acid addition salts include acetates (such as those formed with acetic acid or trihaloacetic acid, for example, trifluoroacetic acid), adipates, alginates, ascorbates, aspartates, benzoates, benzenesulfonates, bisulfates, borates, butyrates, citrates, camphorates, camphorsulfonates, cyclopentanepropionates, digluconates, dodecylsulfates, ethanesulfonates, fumarates, glucoheptanoates, glycerophosphates, hemisulfates, heptanoates, hexanoates, hydrochlorides, hydrobromides, hydroiodides,

[0075] As used herein, the term "pharmaceutically acceptable salts" is intended to mean salts that retain the desired biological activity of the above-identified compounds and exhibit minimal or no undesired toxicological effects.

[0076] Some compounds of the invention may have one or more chiral centers and/or geometric isomeric centers (E- and Z- isomers), and it is to be understood that the invention encompasses all such optical, diastereoisomers and geometric isomers. The invention also comprises all tautomeric forms of the compounds disclosed herein.

[0077] Individual stereoisomers of the compounds of the invention may, for example, be substantially free of other isomers (e.g., as a pure or substantially pure optical isomer having a specified activity), or may be admixed, for example, as racemates or with all other, or other selected, stereoisomers. The chiral centers of the present invention may have the S or R configuration. The racemic forms can be resolved by physical methods, such as, for example, fractional crystallization, separation or crystallization of diastereomeric derivatives or separation by chiral column chromatography. The individual optical isomers can be obtained from the racemates by any suitable method, including without limitation, conventional methods, such as, for example, salt formation with an optically active acid followed by crystallization.

[0078] The present invention also includes prodrugs of compounds of the invention. The term "prodrug" is intended to represent a compound with a covalently bonded carrier, which is capable of releasing the active ingredient when the prodrug is administered to a mammalian subject. Release of the active ingredient occurs *in vivo*. Prodrugs can be prepared by

techniques known to one skilled in the art. These techniques generally modify appropriate functional groups in a given compound. These modified functional groups however regenerate original functional groups by routine manipulation or *in vivo*. Prodrugs of compounds of the invention include compounds wherein a hydroxy, amino, carboxylic, or a similar group is modified. Examples of prodrugs include, but are not limited to esters (e.g., acetate, formate, and benzoate derivatives), carbamates (e.g., N,N-dimethylaminocarbonyl) of hydroxy or amino functional groups in compounds of Formula (I)), amides (e.g., trifluoroacetylamino, acetylamino, and the like), and the like.

[0079] The compounds of the invention may be administered as is or as a prodrug, for example in the form of an *in vivo* hydrolyzable ester or *in vivo* hydrolyzable amide. An *in vivo* hydrolyzable ester of a compound of the invention containing carboxy or hydroxy group is, for example, a pharmaceutically acceptable ester which is hydrolyzed in the human or animal body to produce the parent acid or alcohol. Suitable pharmaceutically acceptable esters for carboxy include C₁-C₆alkoxymethyl esters (e.g., methoxymethyl), C₁-C₆alkanoyloxymethyl esters (e.g., for example pivaloyloxymethyl), phthalidyl esters, C₃-C₈cycloalkoxycarbonyloxy-C₁-C₆alkyl esters (e.g., 1-cyclohexylcarbonyloxyethyl); 1,3-dioxolen-2-onylmethyl esters (e.g., 5-methyl-1,3-dioxolen-2-onylmethyl; and C₁-C₆alkoxycarbonyloxyethyl esters (e.g., 1-methoxycarbonyloxyethyl) and may be formed at any appropriate carboxy group in the compounds of this invention.

[0080] An *in vivo* hydrolyzable ester of a compound of the invention containing a hydroxy group includes inorganic esters such as phosphate esters and α -acyloxyalkyl ethers and related compounds which as a result of the *in vivo* hydrolysis of the ester breakdown to give the parent hydroxy group. Examples of α -acyloxyalkyl ethers include acetoxymethoxy and 2,2-dimethylpropionyloxy-methoxy. A selection of *in vivo* hydrolyzable ester forming groups for hydroxy include alkanoyl, benzoyl, phenylacetyl and substituted benzoyl and phenylacetyl, alkoxycarbonyl (to give alkyl carbonate esters), dialkylcarbamoyl and *N*-(*N,N*-dialkylaminoethyl)-*N*-alkylcarbamoyl (to give carbamates), *N,N*-dialkylaminoacetyl and carboxyacetyl. Examples of substituents on benzoyl include morpholino and piperazino linked from a ring nitrogen atom via a methylene group to the 3- or 4- position of the benzoyl ring. A suitable value for an *in vivo* hydrolyzable amide of a compound of the invention containing a carboxy group is, for example, a *N*-C₁-C₆alkyl or *N,N*-di-C₁-C₆alkyl amide such as *N*-methyl, *N*-ethyl, *N*-propyl, *N,N*-dimethyl, *N*-ethyl-*N*-methyl or *N,N*-diethyl amide.

[0081] Upon administration to a subject, the prodrug undergoes chemical conversion by metabolic or chemical processes to yield a compound of the present invention, or a salt and/or solvate thereof. Solvates of the compounds of the present invention include, for example, hydrates.

[0082] The foregoing merely summarizes some aspects and preferred embodiments thereof and is not intended to be limiting in nature. These aspects and preferred embodiments thereof are described more fully below.

Example 1a

(S)-1-(5-((2-aminopropanamido)methyl)thiophen-3-yl)-N-(2-methoxybenzyl)-3-(trifluoromethyl)-1H-pyrazole-5-carboxamide (9a)

Step 1: 4-nitrothiophene-2-carbaldehyde (1).

[0170] A mixture of fuming HNO_3 (4.0 mL) in conc. H_2SO_4 (3.1 mL) was added to a solution of thiophene-2-carbaldehyde (2.0 g, 17.8 mmol) in conc. H_2SO_4 (4.7 mL) cooled in an ice-salt bath according to the procedure of Pierre Fournari and Jean Paul Chane (Bull. Soc. Chim. Fr., 1963, 479-484). After completion of addition the mixture was stirred for 5 min, then ice was added, and the mixture was extracted with ether. The ether extracts were washed with sat'd NaHCO_3 , then with brine, dried over MgSO_4 , filtered and concentrated giving brown oil. Proton NMR of the crude showed a mixture of the two regioisomers in a ratio of almost 40:60 for 4-nitrothiophene-2-carbaldehyde and 5-nitrothiophene-2-carbaldehyde respectively. The mixture was separated by column chromatography eluting with 30-50% DCM /hexanes. 4-Nitrothiophene-2-carbaldehyde was obtained in 40% yield as a light yellow solid.

^1H NMR (CDCl_3) δ (ppm): 9.95(s, 1H); 8.63 (s, 1H), 8.27 (s, 1H).

Step 2: 4-nitrothiophene-2-carbonitrile (2).

[0171] Acetic anhydride (1.2 mL) was added to a mixture of aldehyde 1 (314.3 mg, 2.00 mmol) and hydroxylamine hydrochloride (277.6 mg, 4.00 mmol) in pyridine (1.5 mL) pre-

heated at 95°C according to the procedure of M. Bobosikova et al. (J. Chem. Soc., Perkin Trans. I, 2001, 680-689). After 2 h at 95°C the mixture was cooled and poured over ice and the precipitate was filtered out and allowed to air dry. Nitrile **2** was obtained in 68% yield as beige solid ¹H NMR (CDCl₃) δ(ppm): 8.51 (s, 1H), 8.14 (s, 1H).

Step 3: 4-aminothiophene-2-carbonitrile (**3**).

[0172] Nitrile **2** (100 mg, 0.65 mmol) in EtOAc (4 mL) and dioxane (0.2 mL) and 5% Pd/C (77 mg) were placed under hydrogen atmosphere. After 16 hours 10% Pd/C Degussa wet catalyst (30 mg) was added and the mixture was stirred under 1 atm of hydrogen for another 24h. The catalyst was filtered over celite and the filtrate was concentrated under vacuum and purified by column chromatography eluting with 20-30% EtOAc/hexanes giving amine **3** in 41%. LRMS (ESI): calc. 124.2; found 125.1 (MH)⁺.

Step 4: 4-(5-(furan-2-yl)-3-(trifluoromethyl)-1H-pyrazol-1-yl)thiophene-2-carboxamide (**4**).

The precipitate that formed was filtered and washed with ice-cold brine (4.5 mL) then with 2:1 Hex: ether (4.5 mL) and was air dried leaving 0.398 g of a beige solid. The material was refluxed with 4,4,4-trifluoro-1-(furan-2-yl)butane-1,3-dione (0.24 g, 1.16 mmol) in acetic acid (4.6 mL) for 16h. The solvent was evaporated, EtOAc and 1N HCl solution were added and organic layer was separated and washed with brine, dried over MgSO₄, filtered and concentrated. The crude material was purified by column chromatography eluting with 20-100% EtOAc:hexanes to give compound **4** as a light yellow solid in 30.6% yield. LRMS (ESI): calc. 327.3; found 328.0 (MH)⁺.

The mixture was cooled in ice and few drops of conc HCl were added, then most of the solvent was removed and H₂O was added and the mixture was heated to reflux for 20 min. EtOAc was added and the PH adjusted to 8 with saturated NaHCO₃ and extracted with EtOAc (2x). The organic extracts were dried over MgSO₄, filtered and concentrated leaving crude **5** (110 mg) as a clear oil. LRMS (ESI): calc. 313.3; found 314.0 (MH)⁺. The material was used as is for the next step.

Scheme 2

Example 1c

(S)-1-(5-((2-aminopropanamido)methyl)thiophen-3-yl)-N-(2-methylbenzyl)-3-(trifluoromethyl)-1H-pyrazole-5-carboxamide (**9b**).

Step 1: Di-tert-butyl 1-(5-formylthiophen-3-yl)hydrazine-1,2-dicarboxylate (**11**)

[0179] To a solution of 5-formylthiophen-3-ylboronic acid (2 g, 12.82 mmol) and di-tert-butyl azodicarboxylate (1.476 g, 6.41 mmol) in THF (12mL) under nitrogen was added copper(II) acetate (0.116 g, 0.641 mmol) in one portion according to the procedure of T. Uemura and N. Chatani (*J. Org. Chem.* **2005**, 70, 8631-8634). The suspension was then stirred for 18.5 hours at room temperature. The resulting brown solution was then concentrated and the residue was dissolved in DCM and methanol and loaded on silica and applied to a 40M Biotage column. Elution with a gradient of 10 to 20% ethyl acetate in hexanes gave compound **11** (1.888g, 86%) as a yellow crust. LRMS (ESI): calc. 342.12; found 365.2 (MNa)⁺.

Step 2: Di-tert-butyl 1-(5-cyanothiophen-3-yl)hydrazine-1,2-dicarboxylate (**12**)

[0180] Hydroxylamine hydrochloride (0.766 g, 11.03 mmol) was added to a solution of compound **11** (1.888 g, 5.51 mmol) in pyridine (5.5mL). The solution was heated to 90 degrees for 10 minutes and then cooled to room temperature. Acetic anhydride (3.23 mL, 34.2 mmol) was then added to the solution. It was then stirred at room temperature for 30 minutes and then at 80 degrees for 1 hour. The reaction was concentrated to half the volume under reduced pressure and then diluted with 300mL of water, extracted into ethyl acetate (3x), washed with brine, dried over Na₂SO₄, filtered and then concentrated. The resulting yellow oil was then purified by silica gel chromatography through a 40M Biotage column with gradient of 12-24% ethyl acetate in hexanes to give compound **12** (1.39g, 74%) as a white crusty solid. LRMS (ESI): calc. 339.13; found 338.1 (M-H)⁻.

Step 3: 4-hydrazinylthiophene-2-carbonitrile hydrochloride (**13**)

[0181] To a stirring solution of compound **12** (1.38 g, 4.07 mmol) in 2-propanol (10mL) was added 4M HCl in dioxane (10 mL, 40.0 mmol). The reaction heated to 80 degrees for 1 hour turning into a dark brown solution. The mixture was evaporated to dryness and the resulting the brown solid suspended and sonicated in diethyl ether. The suspension was filtered to afford compound **13** (0.701g, 97%) as a brown solid. LRMS (ESI): calc. 139.0; found 140.1 (MH)⁺.

Step 4: 4-(5-(furan-2-yl)-3-(trifluoromethyl)-1H-pyrazol-1-yl)thiophene-2-carbonitrile (**14**).

[0182] To a solution of compound **13** (0.701 g, 3.99 mmol) in AcOH (10mL) was added 4,4,4-trifluoro-1-(2-furyl)-1,3-butanedione (0.591 mL, 3.99 mmol). The solution was stirred at 80 degrees for a total of 22 minutes. After the addition of toluene to the brown solution it was concentrated under reduced pressure to a brown-green sludge. The sludge was dry loaded onto a 40M Biotage column and then eluted with a gradient of 5 to 20 % ethyl acetate in hexanes to furnish compound **14** (0.909g, 74%) as a light brown oil which solidified upon standing. LRMS (ESI): calc. 309.2; found 310.1 (MH)⁺.

Step 5: (S)-tert-butyl 1-((4-(5-(furan-2-yl)-3-(trifluoromethyl)-1H-pyrazol-1-yl)thiophen-2-yl)methylamino)-1-oxopropan-2-ylcarbamate (**6**)

[0183] To a solution of compound **14** (0.907 g, 2.93 mmol) at 0 degrees in THF (3mL) and under nitrogen was slowly added 1M borane tetrahydrofuran complex (11.73 mL, 11.73 mmol). The yellow solution was then stirred for 50 minutes at room temperature. It was cooled to 0 degrees and then slowly quenched with methanol (approx. 4mL). After 10 minutes of stirring at room temperature the reaction solution was concentrated under reduced pressure to a yellow, gummy solid and dried under a high vacuum pump. The crude amine **5** was then dissolved in DCM (15mL) at zero degrees and to this was added BOC-Ala-OSu (0.839 g, 2.93 mmol) followed by triethylamine (0.898 mL, 6.45 mmol). The reaction was stirred at zero degrees for 1 hour and at room temperature for 16 hours. The solvent was then removed under reduced pressure and the residue partitioned between ethyl acetate and saturated NH₄Cl. The layers were separated and the ethyl acetate phase washed further with saturated NH₄Cl and then brine, dried over Na₂SO₄, filtered and concentrated. The residue was absorbed onto silica gel and then purified by silica gel chromatography using a 40M Biotage column with a gradient of 20 to 60 % ethyl acetate and hexanes to give compound **6** (0.718g, 51%) as a white crusty solid. LRMS (ESI): calc. 484.1; found 385.1 (MH-Boc)⁺, 507.2 (MNa)⁺.

Step 6: (S)-1-(5-((2-(tert-butoxycarbonylamino)propanamido)methyl)thiophen-3-yl)-3-(trifluoromethyl)-1H-pyrazole-5-carboxylic acid (**7**) and (S)-1-(5-((2-(tert-butoxycarbonylamino)propanamido)methyl)-2-chlorothiophen-3-yl)-3-(trifluoromethyl)-1H-pyrazole-5-carboxylic acid (**8**).

[0184] To a solution of compound **6** (1.20 g, 2.48 mmol) in acetonitrile (7.3 mL) at zero degrees was added sodium dihydrogen phosphate (1.486 g, 12.38 mmol) in water (3 mL). Sodium chlorite (2.240 g, 24.77 mmol) in water (10mL) was then added slowly to the reaction. It was then stirred quickly at room temperature for 2 hours. The yellow colored biphasic reaction was then quenched with 15 % NaOH (100mL) and washed with dichloromethane. The combined dichloromethane layers were extracted with 15% NaOH. The aqueous phases were combined and then acidified with concentrated HCl (aq.) (50mL) to give a cloudy yellow suspension. The suspension was extracted into ethyl acetate (3x), dried over Na₂SO₄, filtered and concentrated to give a yellow crusty solid. It was then purified by silica gel chromatography using a 40M Biotage column and a gradient of 5 to 10% methanol in DCM (1% AcOH) to give an inseparable mixture of compounds **7** and **8** in a ratio of 3:1 by proton NMR (0.689g combined, approximately 60% yield) as a yellow crust. LRMS (ESI): calc. 462.1 for **7**; found 461.1 (M-H)⁻, and calc. 496.9 for **8**; found 495.1 (M-H)⁻.

ammonium formate (450mg, 7.14mmol) and Pd/C (60mg) was added. The heating was then continued for another 7.5 hours before another portion of ammonium formate (250mg, 3.96mmol) and Pd/C (60mg) was added. The reaction was then left for another 16 hours. The suspension was then filtered through celite and the filtrate concentrated under reduced pressure. The residue was dissolved in water and acidified with 1N HCl. The milky white suspension was then extracted into ethyl acetate, washed with brine, dried over Na₂SO₄, filtered and evaporated to give only compound **7** a yellow crust (518.4mg, 99%). LRMS (ESI): calc. 462.1; found 461.1 (M-H)⁺

Step 8: (S)-tert-butyl 1-((4-(5-(2-methylbenzylcarbamoyl)-3-(trifluoromethyl)-1H-pyrazol-1-yl)thiophen-2-yl)methylamino)-1-oxopropan-2-ylcarbamate (**15a**).

[0186] To a solution of 2-methylbenzylamine (0.037 mL, 0.295 mmol) and compound **7** (0.091 g, 0.197 mmol) in dichloromethane (2mL) under nitrogen was added EDC (0.075 g, 0.394 mmol) followed by DMAP (9.62 mg, 0.079 mmol). The reaction was left to stir for 16 hours at room temperature. The solvent was then removed on the rotary evaporator and the brown material was purified by silica gel chromatography with a 12M Biotage column and a gradient of 0-5% methanol in dichloromethane to give 61.3mg of a yellow crust. The sample was further purified by preparative HPLC (C18 Aquasil 20x250mm; 40-85% methanol in water in 45 minutes at 10mL/min) to afford compound **15a** (34.4mg, 31%) as a white crust. LRMS (ESI): calc. 565.2; found 466.1 (MH-Boc)⁺, 588.2 (MNa)⁺.

Step 9: (S)-1-(5-((2-aminopropanamido)methyl)thiophen-3-yl)-N-(2-methylbenzyl)-3-(trifluoromethyl)-1H-pyrazole-5-carboxamide (**9b**).

[0187] Compound **15a** (34.4mg, 0.061 mmol) was shaken in a solution of 30% TFA in dichloromethane (1mL) at room temperature for 1 hour. Step 1: 3-(5-hydroxy-3-(trifluoromethyl)-1H-pyrazol-1-yl)benzonitrile (**130**)

[0312] A mixture of **22** (0.5 g, 1.549 mmol) and ethyl 4,4,4-trifluoroacetoacetate (0.23 mL, 1.549 mmol) was heated in EtOH (5 mL) and acetic Acid (1 mL) for 5 hours at 90 °C. It was cooled to room temperature and poured over NaHCO₃ (satd) and the product was extracted with ethyl acetate, washed with water, brine, dried over Na₂SO₄, filtered and concentrated. The residue was purified by silica gel chromatography (Biotage 25M, 0 to 20% ethyl acetate in DCM) to give **130** (162mg, 0.640 mmol, 41.3 % yield) as yellow solid. LRMS(ESI): (calc.) 253.2 (found) 254.0 (MH)⁺

Compositions

[0426] In a second aspect, the invention provides compositions comprising a compound according to the invention and a pharmaceutically acceptable carrier, excipient, or diluent. Compounds of the invention may be formulated by any method known in the art and may be prepared for administration by any route, including, without limitation, parenteral, oral, sublingual, transdermal, topical, intranasal, intratracheal, or intrarectal. In certain preferred

embodiments, compounds of the invention are administered intravenously in a hospital setting. In certain other preferred embodiments, administration may preferably be by the oral route. The compositions may be in any form, including but not limited to, liquid solutions or suspensions; for oral administration, formulations may be in the form of tablets or capsules; and for intranasal formulations, in the form of powders, nasal drops or aerosols. The compositions of the invention may be administered systemically or locally.

[0427] The characteristics of the carrier, excipient or diluent will depend on the route of administration. As used herein, the term "pharmaceutically acceptable" means a non-toxic material that is compatible with a biological system such as a cell, cell culture, tissue, or organism, and that does not adversely interfere with the effectiveness of the biological activity of the active ingredient(s). Thus, compositions according to the invention may contain, in addition to the compound, diluents, fillers, salts, buffers, stabilizers, solubilizers, or other materials well known in the art. The preparation of pharmaceutically acceptable formulations is described in, e.g., Remington's Pharmaceutical Sciences, 18th Edition, ed. A. Gennaro, Mack Publishing Co., Easton, PA, 1990.

[0428] The active compound is included in the pharmaceutically acceptable carrier or diluent in an amount sufficient to deliver an inhibition effective amount without causing serious toxic effects. The effective dosage range of the pharmaceutically acceptable derivatives can be calculated based on the weight of the parent compound to be delivered. If the derivative exhibits activity in itself, the effective dosage can be estimated as above using the weight of the derivative, or by other means known to those skilled in the art.

[0429] Depending on the particular condition, or disease, to be treated, additional therapeutic agents, that could be normally administered to treat that condition, or disease, may also be present in the compositions of this invention. In other words, compounds of this invention can be administered as the sole pharmaceutical agent or in combination with one or more other additional therapeutic (pharmaceutical) agents where the combination causes no unacceptable adverse effects. This may be of particular relevance for the treatment of hyper-proliferative diseases such as cancer. In this instance, the compound of this invention can be combined with a known anti-cancer agent(s), as well as with admixtures and combinations thereof. As used herein, additional therapeutic agents that are normally administered to treat a particular disease, or condition, are known as "appropriate for the disease, or condition, being treated". As used herein, "additional therapeutic agents" is meant to include, for example, chemotherapeutic agents and other anti-proliferative agents. Administration of such agents may be done sequentially or concurrently. In certain preferred embodiments of the present invention the composition comprises a compound according to the present invention and a PRMT and/or CARM-I inhibitor known in the art or which will be discovered. The active ingredients of such compositions preferably act synergistically to produce a therapeutic effect.

Inhibition of Protein Methyltransferase

[0430] In a third aspect, the present invention provides a method of inhibiting PRMT and/or CARM-I, comprising contacting the PRMT and/or CARM-I with an inhibition effective amount of a compound according to the present invention.

[0431] In another embodiment of the third aspect, the invention provides a method of inhibiting PRMT and/or CARM-I in a cell, comprising contacting the cell in which inhibition of PRMT and/or CARM-I is desired with an inhibition effective amount of an inhibitor of PRMT and/or CARM-I, or composition thereof, according to the present invention.

[0432] Because compounds of the invention inhibit PRMT and/or CARM-I, they are useful research tools for *in vitro* study of PRMTs and/or CARM-I and their role in biological processes.

[0433] Measurement of the enzymatic activity of a PRMT and/or CARM-I can be achieved using known methodologies. For example, WO 2006/069155, describes the assessment of CARM-I enzymatic activity by the detection of methylated Histone H3.

[0434] In some preferred embodiments, the PRMT and/or CARM-I inhibitor interacts with and reduces the activity of all protein arginine methyltransferases in a cell. In some other preferred embodiments according to this aspect of the invention, the PRMT and/or CARM-I inhibitor interacts with and reduces the activity of fewer than all protein arginine methyltransferases in the cell. In certain preferred embodiments, the inhibitor interacts with and reduces the activity of CARM-I but, does not interact with or reduce the activities of other protein arginine methyltransferases.

[0435] The term "inhibition effective amount" is meant to denote a dosage sufficient to cause inhibition of PRMT and/or CARM-I activity in a cell, which cell can be in a multicellular organism. The multicellular organism can be a plant or an animal, preferably a mammal, more preferably a human. If in a multicellular organism, the method according to this aspect of the invention comprises administering to the organism a compound or composition according to the present invention. Administration may be by any route, including, without limitation, parenteral, oral, sublingual, transdermal, topical, intranasal, intratracheal, or intrarectal. In certain particularly preferred embodiments, compounds of the invention are administered intravenously in a hospital setting. In certain other preferred embodiments, administration may preferably be by the oral route.

[0436] In certain preferred embodiments of the third aspect of the invention, the method further comprises contacting a PRMT and/or CARM-I enzyme or a cell expressing PRMT and/or CARM-I activity with an additional inhibitory agent. The combined use of separate agents results in an improved inhibitory effect, thereby reducing the amounts of individual inhibitors required to obtain a given inhibitory effect as compared to the amounts necessary when either is used alone. Administration of such separate agents may be done sequentially

or concurrently. When co-administered, the separate agents preferably act synergistically to produce a therapeutic effect.

[0437] The present invention will be more readily understood by referring to the following examples, which are given to illustrate the invention rather than to limit its scope.

ASSAY EXAMPLES

Assay Example I

Inhibition of Enzymatic Activity

[0438] The following protocol is used to assay the compounds of the invention for inhibition of CARM-1 methylation activity.

[0439] Histone H3 (Sigma-Aldrich) is used as the substrate for CARM-1 enzyme (Millipore), and the methylation is monitored using tritiated S-Adenosyl-Methionine (SAM) (Amersham Pharmacia Biotech) as a methyl donor. The reactions are performed at room temperature for a total of 30-35 minutes, using enzyme (CARM-1), substrate (histone H3), and co-factor (SAM) in the absence and presence of compound.

I. Reaction Mixtures and Solutions:

5x Histone Methyltransferase Buffer (HMTB; Millipore):
250 mM Tris-HCl, pH 9.0
2.5 mM dithiothreitol

10x Compound Solution (2 μ L per well):
Test compounds are diluted in 100% DMSO

CARM-1 Enzyme Mixture (8 μ L per well):
0.75 μ L of 1 μ g/ μ L CARM-1 enzyme
4 μ L HMTB
3.25 μ L H₂O

Histone H3/[³H] SAM Mixture (10 μ L per well):
2 μ L of 1 mg/mL histone H3
1 μ L 0.55 mCi/mL [³H]-SAM
7 μ L H₂O

Wash Buffer (WB):
10% trichloroacetic acid

II. Reaction Steps:

The reaction mixtures and solutions are added in the following order:
2 μ L Compound Solution
8 μ L CARM-1 Enzyme Mixture

[0440] The mixture is left to pre-incubate for 10 minutes at room temperature (20-23°C), followed by the addition of 10 µL Histone H3/[³H] SAM Mixture. This is left to incubate for an additional 20 minutes at room temperature, and then 5 µL of the mixture is spotted onto P30 Filtermat paper. The Filtermat is washed twice for 15 minutes each with WB, and then washed once for 5 minutes with 95% ethanol. The Filtermat is allowed to dry and is placed on a heating plate pre-warmed at 70-75°C. A sheet of melt-on scintillant is placed on top and allowed to melt. The Filtermat is then removed from the heating plate and the wax allowed to solidify. The Filtermat is then placed in a sample bag, heat sealed, and read using a Wallac Microbeta counter. The data is analyzed to generate IC₅₀ values.

[0441] Compounds of the present invention have activity in the above described assay. Compounds of the present invention described herein have an IC₅₀ of less than 10 µM.

[0442] The pharmacological properties of the compounds of the present invention may be confirmed by a number of pharmacological assays. Inhibition of tumor cell proliferation upon treatment with compounds of the invention, for example, can be monitored using known methodologies. For example, WO 2006/069155, describes the use of a 3H thymidine incorporation assay.

[0443] While the invention has been described in connection with specific embodiments thereof, it will be understood that it is capable of further modifications and this application is intended to cover any variations, uses, or adaptations of the invention following, in general, the principles of the invention and including such departures from the present disclosure as come within known or customary practice within the art to which the invention pertains and as may be applied to the essential features hereinbefore set forth, and as follows in the scope of the appended claims.

Box No. II Observations where certain claims were found unsearchable (Continuation of item 2 of the first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons :

1. ☒ Claim Nos. : 71-73

because they relate to subject matter not required to be searched by this Authority, namely :

Claims 71-73 are directed to a method for treatment of the human or animal body by surgery or therapy, and are not required to be searched nor is a written opinion required by this Authority. Regardless, this Authority has established a written opinion based on the alleged effect or purpose/use of the product defined in claims 1-67.

2. ☒ Claim Nos. : 1-73

because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically :

The claims on file define an infinite number of compounds such that a meaningful search over the whole scope of the claims could not be carried out. The search was thus limited to compounds disclosed in tables 1, 2, 5 and 10 and in example 45 of the description, representative of compounds of formulae (I), (II) and (III) (See page 5 of PCT/ISA/210).

3. ☐ Claim Nos. :

because they are dependant claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box No. III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows :

The claims are directed to a plurality of alleged inventions. Each individual invention is not only defined by the choice of one of the three claimed formulae, but, within the definition of said formulae, it is also defined by the combination of the variables that are present in each formulae. Notice that the elements constituting said variables belong to classes of compounds not related to each other, so that no common unifying characteristic can be found. Furthermore, compounds of formulae (II) and (III), as well as their use as inhibitors of PRMTs, are known in the art. Hence the claims also lack unity *a posteriori*.

The claims must be limited to an inventive concept only as set out in Rule 13 of the PCT.

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. ☒ As all searchable claims could be searched without effort justifying additional fees, this Authority did not invite payment of additional fees.

3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claim Nos. :

4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claim Nos. :

Remark on Protest ☐ The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee.

☐ The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation.

☐ No protest accompanied the payment of additional search fees.

Continuation of Box II.2

A keyword search of the databases delineated on page 3 of PCT/ISA/210 was carried out as well.

Applicant's attention is drawn to the fact that claims, or part of claims, relating to inventions in respect to which no International Search Report has been established, need not be the subject of an international preliminary examination (Rule 66.1(e) of the PCT).
